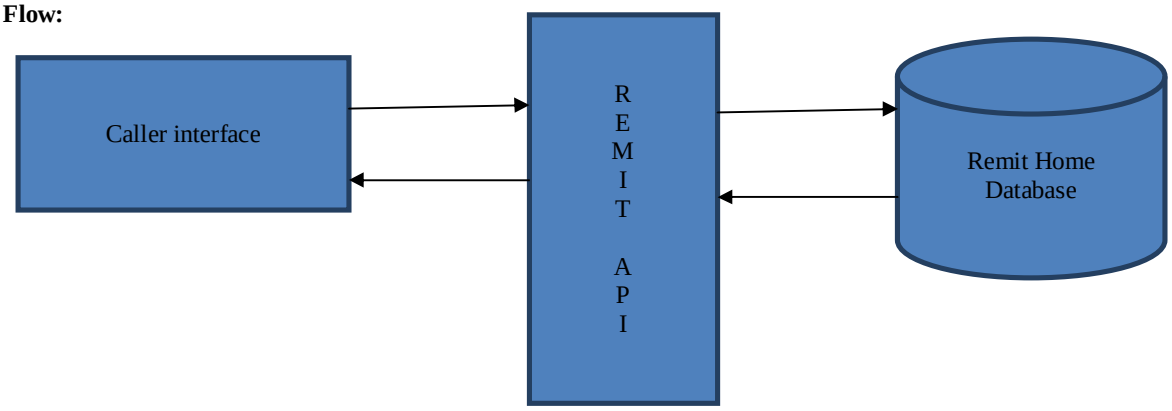
Subject: RE:JSBL-RH- Tracker request for website

Scope of Work

1. A Web API will be exposed or provided to JSBL.
2. JSBL will further expose it to the internet based web application or interface (remittance tracker).
3. Upon calling that particular method, transaction's information will be provided in the form of JSON.
4. JSBL IT will parse that JSON according to their requirements and will display the contents on their interface.
5. Remit application/exposed API will work in the background and have nothing to do with any sort of front layout/interface presentation.
6. API's job will be to get request process it and return back the response to the caller.


Flow:
