1. Overview & Background

The transaction volume of RTGS has been significantly increased and is expected to be increased further due to the decision taken by SBP to allow customers' funds transfers for lower limits. Therefore, considering the increasing trend in RTGS transfers SBP has initiated STP project to automate the RTGS payments to minimize manual workload of customers' requests for RTGS.

This will not only help us in reducing the TAT due to duplicate efforts put in by the relevant departments due to manual posting in core banking system and PRISM but will also help us in improving our processing capabilities to manage additional transactional volume within the window allowed by SBP for RTGS payments.

Straight through Processing (STP) is an initiative used in the financial world to optimize the speed at which transactions are processed. This is performed by allowing information that has been electronically entered to be transferred from one party to another in the settlement process without the need for re-keying the same pieces of information repeatedly over the life cycle of the transaction.

About RTGS System

RTGS system started its operations in July 2008. Since its inception, enrollment of the participants is growing and volume of transactions is also increasing.

Payment System Department has also introduced Customer Transfers (MT103) and Multiple Credit Customer Transfer (MT102). This has further increased volume of transactions.

Currently, RTGS Participants are entering transactions in RTGS system manually using RTGS Client workplaces installed at their own premises. Same transactions they also have to re-enter in their Core Banking System through its own workplaces. Multiple re-keying is inefficient and error prone. Soon it will also be impractical to enter all these transactions manually due to increase in volume.

Therefore, it was decided to introduce STP (Straight Through Processing) to deal with the above mentioned issues. STP will electronically connect Participant Core Banking system with RTGS system using standard interfaces that are already provided with the RTGS system.

In this connection, Participants needs to develop an Integration Software that can pick up information from their Core Banking System and transfers it to RTGS system for processing and vice versa.

2. Bank Requirement Scope

However, since the bank has opted option of File Adapter without “Controller”; therefore it is essential to develop “INTEGRATION SOFTWARE” to cater the need of “controller” which currently provided by SBP as part of PRISM to perform multiple functions, which includes but not limited to authorization of MT102, MT103, MT202, Balance enquiry, monitoring of inflows and outflows, free format messaging and any other functionality which is currently available in the PRISM Controller provided by SBP.

The integration software should have the capability of interfacing with partner applications i.e. Remit Home System, CMS Application, T-24 and any other application which requires to be integrated with integration software.

Upon receiving the RTGS instructions from any of the partner application, the integration software, should convert the message based on its payment type (as per SBP’ prescribed formats of MT-102, MT-103 and MT-202) and push the outward MTs to PRISM by following all the relevant protocols to meet SBP’ requirements. Similarly, the integration software should have the capability to receive incoming RTGS received via PRISM from other banks for various departments/customers of the bank.

Scope Requirement

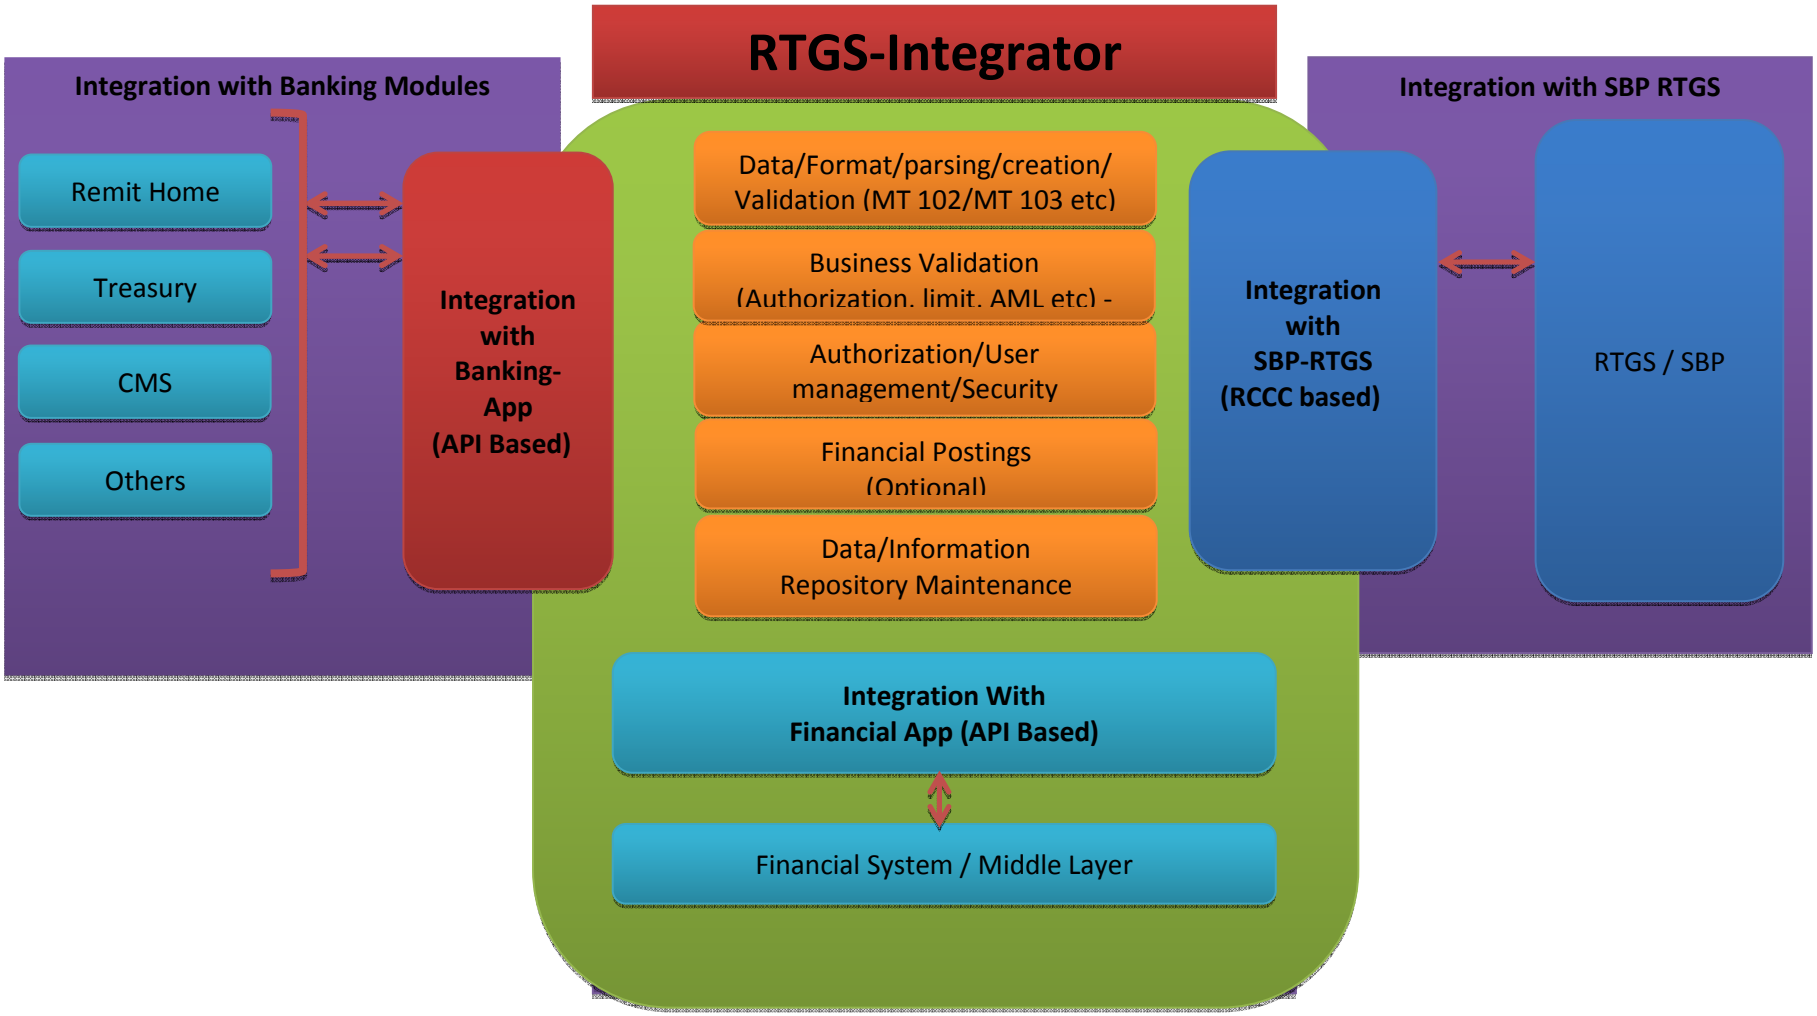

Ref	Module	Option-1	Option-2	Option-3	Option-4	Bank Requirement
A	Integration with Banking modules	PUSH model APIs (Integrator's own)	PULL model APIs (Client/Bank own)	File based for both (IN and OUT)	ISO messages (Phase 2)	**Module** / **Option**: Home Remittance – **1**; Treasury – **1**
B S	Integration with Financial System	APIs (Integrator's own)	APIs (Client/Bank own)	File based for both (IN and OUT)	ISO messages (Phase 2)	**Option – 2**
C S	Integration with SBP/RTGS/PRISM	Through RCCC/API provided by SBP	File based for both (IN and Out)			**Option- 1**

Scope Finalization

Ref	Interfacing	Scope Requirement
A	Integration with Banking modules	Home Remittance – APIs (Integrator's own) Treasury – APIs (Integrator's own)
B	Integration with Financial System	API (Bank's provided)
C	Integration with SBP-RTGS(PRISM)	Through RCCC/API provided by SBP

Supporting SWIFT Messages: MT-102/103/202/296/299/900/910

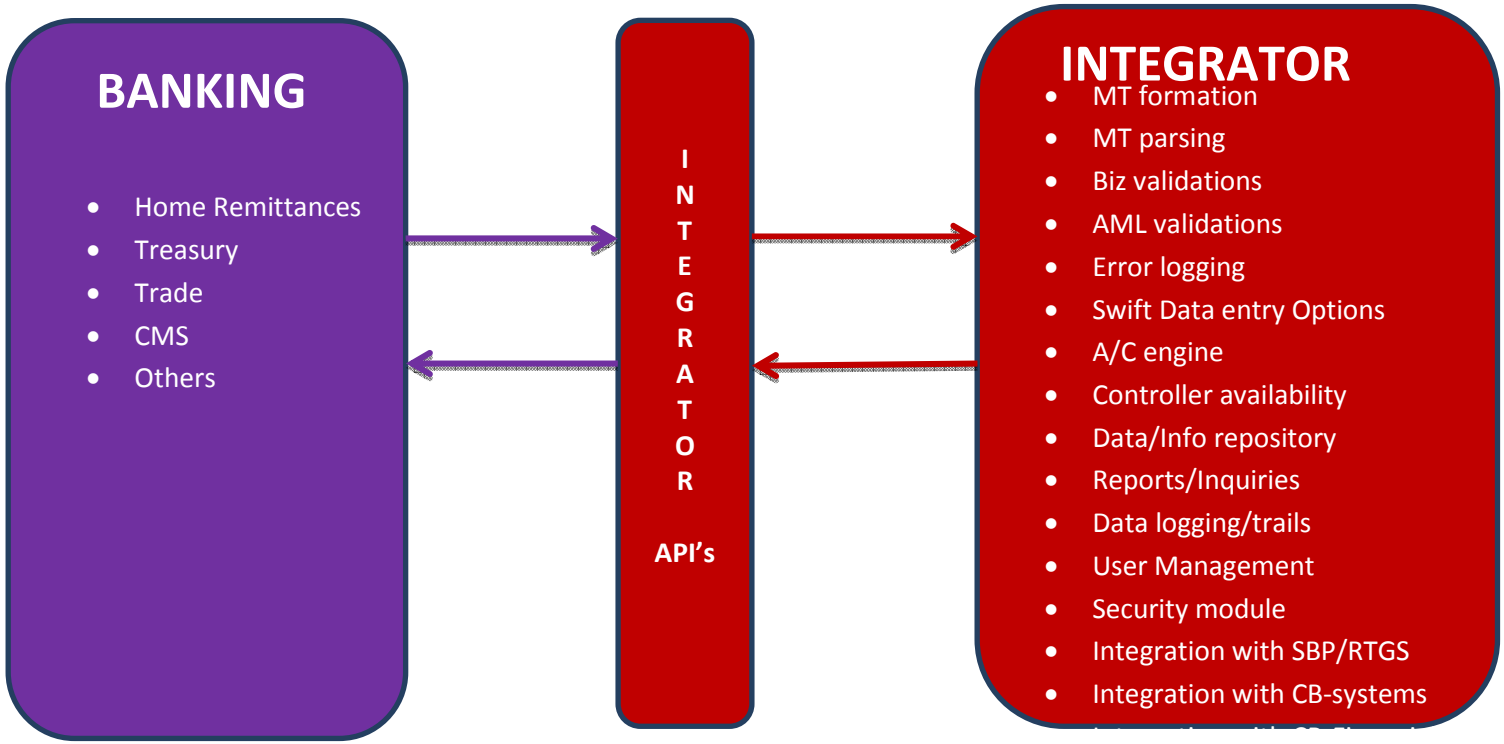

3. Architectural Diagram

4. Integration with Banking Modules

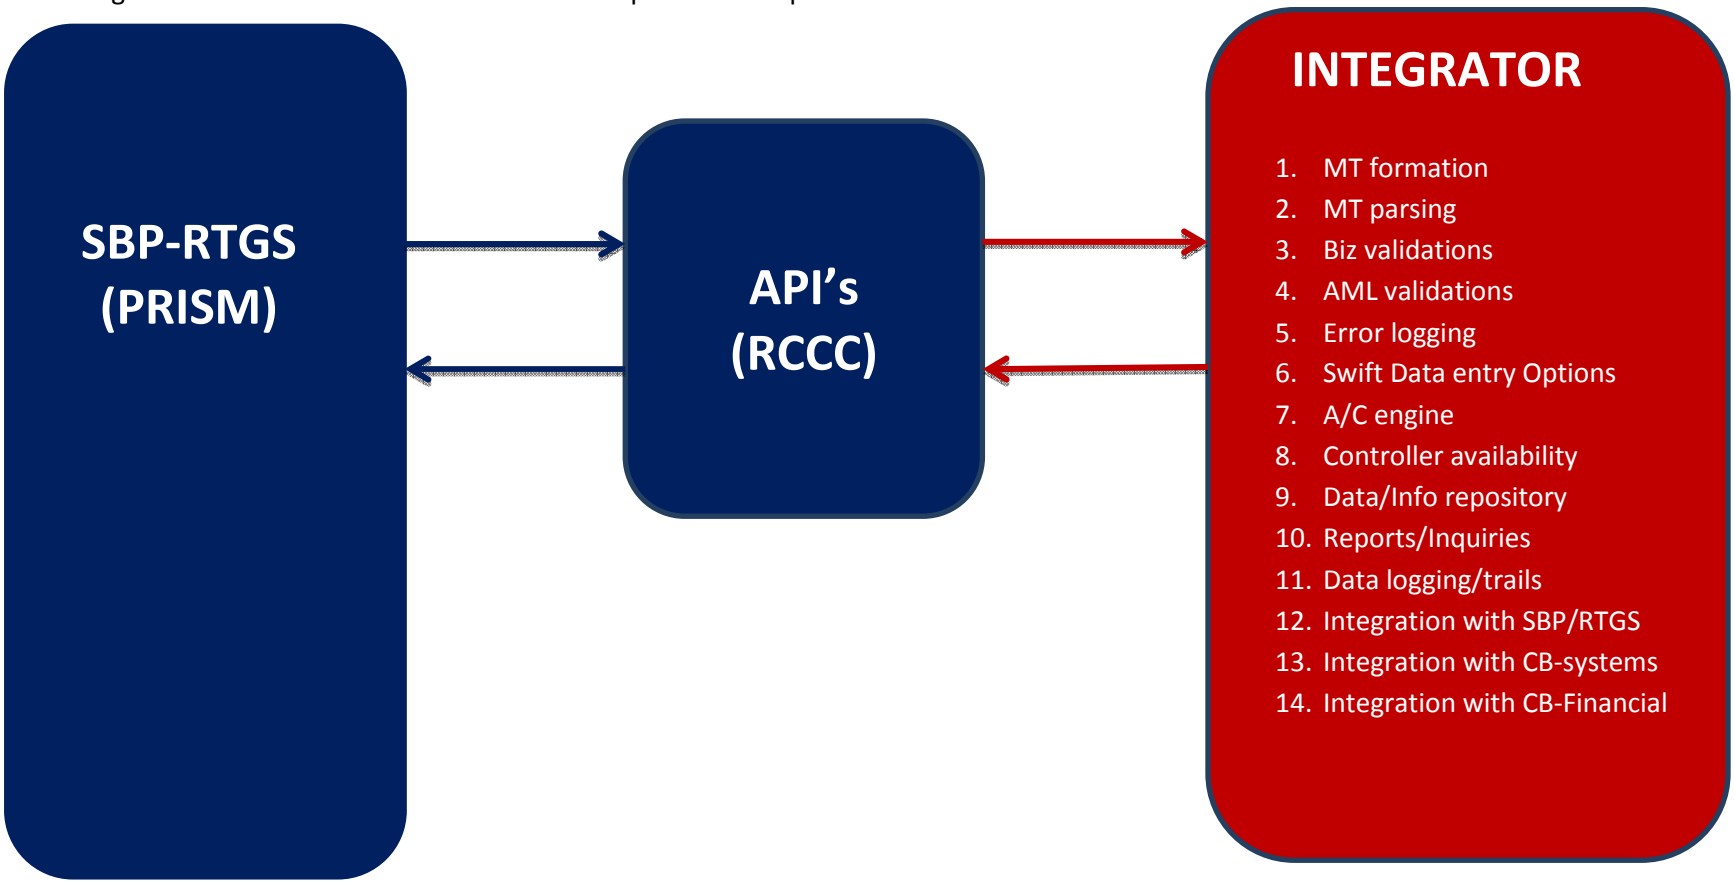

Banking applications (Home remittances, Treasury etc)

- Send data by calling API method provided by Integrator.
- Get data acceptance response from Integrator, acknowledging that transactions have been received.
- Get the status information of the data send by calling status method of Integrator.
- Get data by calling API method provided by Integrator.
- Update the status of transactions that they have received (Incoming transactions) by calling API method.
  Note: For 'RemitHome' application a windows service will be developed by that will keep on checking the statuses of the data sent to RTGS-Integrator.

5. Integration with SBP RTGS (PRISM)

- Integrator will integrate with SBP-RTGS through provided API/RCCC.
- Integrator will send the data to SBP-RTGS and update the response received from SBP-RTGS.

6. Integration with Financial System

- Integrator will integrate with financial system through provided API's.
